# WHAT IS GENERATOR?

## Generator vs. list

# Generator

one item at a time and  
generates item only when  
in demand

# Generator

```
def pick_one_orange(total_oranges):  
    orange_index = 0  
    while orange_index < total_oranges:  
        yield orange_index  
        orange_index += orange_index
```

```
next(pick_one_orange(100))
```

No, I want  
another one

# List

[🍊, 🍊, 🍊, ... 🍊]

python reserves memory for  
the whole list

# List

```
def pick_all_oranges(total_oranges):  
    oranges_box = range(1, total_oranges)  
    return list(oranges_box)
```

this is all the oranges  
that I have . choose the  
orange that you  
want from the oranges  
"list"

Generator  
expressions are  
memory efficient  
than the lists.
